

IF YOUR FURNACE ISN'T WORKING...

Here's what you can check!

Plugged Filter

Check that your filter is not full of dust and debris.

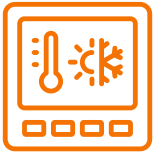

Plugged Exhaust or Air Intake

Take a step outside and check that these two pipes are clear.

Breaker / Switch Off

Check to ensure that both your breaker and equipment switch is in the "on" position.

Thermostat settings

Ensure that your thermostat is set to "heat".

Gas valve / propane

Gas valve may be in "off" position. If you have a propane furnace, also check your propane levels, you might be out of fuel!

Still not working? Call the experts!

Contact us and we will book a technician to sort out your equipment woes! Please have the following information for us:

- Details of the problem
- Equipment model and serial number
- Date of your last maintenance/cleaning service
